EDUCATION

Bachelor of Technology, VIT Bhopal University, Computer Science and Engineering **CGPA: 9.11** 2027
Grade XII, Vidyatree Modern World School **Percentage: 95.25** 2023

TECHNICAL SKILLS

- **Programming Languages:** C/C++, SQL
- **ML/AI:** TensorFlow, Scikit-learn, pandas, FastAPI, NumPy, OpenAI Gym, OpenCV, MediaPipe, Pydantic
- **Developer tools:** GitHub, Git, Docker, MySQL, PostgreSQL
- **Core concepts:** Neural networks, Reinforcement Learning, Embeddings, Recommendation systems, Cosine Similarity search, NLP, LLM Pipelines

PROJECTS

DepoIndex: AI Legal document indexing LLM APIs, Prompt Engineering, PDF Processing

- Engineered an AI-powered tool to automate the generation of a table of contents from legal deposition PDFs using an efficient preprocessing pipeline that annotates text with precise page and line numbers, minimizing prompt token count while enabling the LLM to extract topics with accurate source references.
- Achieved **95% page-level and 85% line-level accuracy** in topic referencing, delivering a highly reliable tool for rapid automated document indexing.

Attentia: Adaptive Learning for neurodivergent children FastAPI, OpenCV, MediaPipe, Q-learning

- Designed an adaptive learning system that detects attention/emotional state and performs tailored interventions (e.g., adjusting course difficulty, soothing with music, reducing distraction via animations). Built the training environment for the Q-learning engine using a mix of deterministic and stochastic rules to simulate user behavior.
- Engineered multi-modal attention detection pipelines (facial landmarks, head pose, audio signals) with personalized baseline calibration, using a persistent singleton architecture for efficient and accurate real-time engagement tracking and low-latency FastAPI integration.

MovieLens: Semantic movie search FastAPI, Docker, TensorFlow, Embeddings, Recommendation systems

- Deployed a production grade **below 50ms FastAPI+Docker inference pipeline** semantic search system to convert raw user input tags into 100-D embeddings, and retrieve movies via vectorized cosine similarity against movie embeddings derived from **matrix factorization**.
- Engineered a 500-token tag vocabulary and a hypersphere-normalized text-to-vector neural network for **solving the hubness problem** and also solving the cold-start problem by generating embeddings from tags alone, that achieved **0.52 cosine similarity**.

Rescue: Environment Navigation Multi Agent reinforcement Learning, Custom environment

- Developed autonomous agents using Q-learning to optimize pathfinding in a dynamic, multi-agent search simulation of natural disaster environments, **reducing search time by 90%** compared to random walk .
- Custom-built a multi-agent physics environment from scratch modeling Social Forces Movement and Kinetic theories to benchmark agent pathfinding against standard baselines.

ACHIEVEMENTS AND CERTIFICATIONS

- **Generative AI training by Kaggle and Google(2024):** Transformers, LLMs, and prompt engineering.
- **Global Rank 8261, TCS CodeVita (2024):** Solved advance algorithmic problems.
- **Google Certified Computer networking** Bits and Bytes of Computer Networking
